

Christian van der Loo

Founder & Software Engineer | Littleton, Massachusetts

(513) 739-9901; chris.vanderloo@icloud.com; @chrisvander on GitHub; linkedin.com/in/chris-vanderloo

PROFILE

Technical co-founder of Bluefin Clinical, an acquisition-stage SOC 2-compliant company with enterprise pharma customers and \$250k ARR on a Rust/TypeScript/Kubernetes stack. Strong experience in software architecture and design, translating deep technical problems into fast, reliable, intuitive products with real impact.

EXPERIENCE

CTO & Co-Founder, Bluefin Clinical; Remote

Nov 2022 - Present

- Co-founded clinical supply forecasting company, reaching \$250k ARR on \$25k-\$80k ACV deals with 90%+ RFP win rate. Supported 40+ studies including two top-50 pharma customers.
- Hired and mentored additional engineer; supported with performance evaluations and ongoing direction.
- Designed, built, and sold SOC 2 Type II-compliant clinical supply forecasting platform from zero to production in 10 months, passing large pharma procurement scrutiny. Developed system architecture (TypeScript / React / Rust) and selected technology stack, including data modeling and infrastructure (Kubernetes, AWS, PostgreSQL).
- Acted as the sole engineer for the first version, winning our first two customers. Performed all technical sales and installations activities for the first wins, including demonstrations, Q&A, and ongoing support.
- Built high-performance, WASM-based Rust forecasting engine running on-device delivering feedback in <2s for complex, multi-arm studies, supporting real-time planning and a fast user experience. Implemented LLM-powered data extraction from clinical trial protocols and Model Context Protocol (MCP) server.
- Pre-pivot, I built a production-ready product for investor relations in 3 months, integrated with FactSet financial data. Pivoted to clinical supply chain after identifying stronger market fit.

Associate Technical Staff, MIT Lincoln Laboratory; Lexington, MA

Jan 2022 - Nov 2022

- Led 4-person development team to rewrite chemical plume modeling decision support tool in 3 months for external stakeholders. Made it deployable on-device without network connectivity. Containerized multi-language services (Fortran, Java, Python) using Docker, with RabbitMQ to coordinate services.
- Developed Monte Carlo inference experiments in Julia on MIT HPC clusters (SLURM) to model disease transmission over mobility networks. Analyzed with Python. Achieved better parameter estimation than baseline methods via probabilistic programming, with published results ([PLOS Computational Biology, 2022](#)).
- Evaluated and deployed multivariate anomaly detection models in MATLAB and PyTorch to NVIDIA Jetson edge hardware for real-time inference. Ingested data through Logstash and indexed with Elasticsearch.

Assistant Technical Staff, MIT Lincoln Laboratory; Lexington, MA

May 2021 - Jan 2022

- Developed the Tagging Rapid Assessment Toolkit (TagRat), a data collection Android app for the [Urban Threat Dispersion program](#), a large-scale gas sampling study. Enabled collection of ~5,000 samples over 5 days across 200+ devices, streaming data to a Node.js/MongoDB backend for real-time monitoring and analysis.
- Developed Android app to program an auto-rotating air sampler with a built-in Raspberry Pi using near-field communications (NFC) technology. Deployed during the Urban Threat Dispersion program.
- Given an “Individual Contributor Award” for my performance, problem solving, and “superbly positive attitude.”

EDUCATION

Rensselaer Polytechnic Institute, Troy, NY — B.S. Computer Science & Cognitive Science,

Rensselaer Polytechnic Institute, Troy, NY — M.S. Computer Science (**RNN focus**), 2021

SKILLS

Languages: Rust (wasm-bindgen, DataFusion), TypeScript, Python, Swift, Objective-C, Julia, Java, C/C++ (CUDA), Go

Tools/Frameworks: React, PyTorch, Tensorflow, SwiftUI, Kubernetes, Docker, PostgreSQL, SQLite
